Module structure

In this module you will learn about the assessment and management of a child with a cough or difficult breathing. The caregiver of any sick child presenting to a health centre should be asked about the presence of this common symptom.

The problem may be a cold, or it may be a more serious problem such as pneumonia. How do you tell the difference? How should you treat the child?

How should you counsel the mother? This module will assist you in making the correct decisions.

Approximate module completion time: 90 - 120 minutes
